

Breast Augmentation - Enhancement

Breast Augmentation is a cosmetic procedure that enhances the size and shape of the breast. For personal reasons, many women feel that their breast size is too small. They may also want to correct a reduction in breast volume after pregnancy or possibly balance a difference in breast size. By inserting an implant behind each breast a woman's bust line can increase by one or more bra cup sizes. Breast augmentation is designed to create fuller, firmer breasts that will complement your natural body curvature. The procedure often improves one's appearance and may have a positive effect on self-esteem and self confidence. It is like any other lifestyle decisions and is a matter of personal choice

Women considering breast augmentation should research as much information as possible regarding the procedure. This should include information such as when surgery is right for your body and lifestyle, and what kind of results you can expect. Dr. Gahankari a highly-trained surgeon who is committed to helping his patients achieve their goals through breast augmentation.

The surgical procedure is safe, predictable and has minimum risks in trained hands of Dr Gahankari. This procedure is performed by Dr Gahankari in a fully accredited hospital, with the assistance of a qualified anaesthetist. It is commonly performed as a day surgical procedure. The process involves first a complimentary consultation with our experienced and friendly nurse about the procedure and sizing, and subsequently a consultation with Dr Gahankari. Deciding the appropriate size and type of the implants is the critical step. During this consultation, decisions are also made with regards to the type of the implant (silicone gel or saline), type of implant surface (smooth or textured) and shape of the implant (round or tear drop). It is also decided whether the implant is to be placed under or over the muscle. Dr Gahankari and his team will help you make these decisions in a friendly and a non-hurried manner. We encourage you to bring along a friend or a family member whom you trust.

As part of the recovery you may experience swelling and bruising for some weeks as well as over or under sensitive skin. Although rare, complications such as infection, blood or fluid collection, scaring and asymmetry may result from breast augmentation. Dr. Gahankari will take all possible measures to ensure that the risk of complications is minimised. Scientific studies have proven that the current generation of breast implants are safe and that they have no relationship to breast cancer.
